

Drawing File to Recreate

Notes:

1. Make sure your units are **millimeters**.
2. The two primary views shown are the front view and the right view.
3. A section line is cut out through the origin on the front view, and the projected cutout geometry is shown on a view **Section A-A** above the front view.
4. The top right corner is an isometric view of the file.
5. Dimensions were imported using **Model Items** button under the **Annotations** toolbar. No hidden lines needed to be shown in this figure, as they would only clutter the drawings. The cut out view is more appropriate here.
6. Manually adding dimensions in is perfectly acceptable, also.
7. If you choose to import the dimensions, you may get extra dimensions as well that you do not want. Do NOT leave these dimensions in the drawing file. You must delete them.

Save file as "Firstname_lastname_WS4.slddrw"

Make sure to upload both the part and drawing files.
